flexible light emitting diodes are versatile lighting solutions that offer bendable and adaptable illumination possibilities a soft flexible white luminescent film 1 mm shows promise for foldable electroluminescent devices and applications this film was fabricated using zns ag and mn under different excitation wavelengths the phosphors emit blue light due to ag luminescence centers and red light from the d d transition of mn² the blue emission is greatly suppressed at high mn² doping levels requiring reduced ag doping in co doped zns ag mn compared to solo doped zns ag samples by adjusting ag and mn² concentrations the zns ag 1 mn 0 2 phosphors show a proper intensity ratio of blue and red emissions making them a promising candidate for future white light applications

rather by I. Bickerstaffe? The second edition 1800 some issues contain the papers of the meetings on the critical assessment of techniques for protein structure prediction
