the book gathers articles that were exposed during the seventh edition of the workshop data analysis in astronomy it illustrates a current trend to search for common expressions or models transcending usual disciplines possibly associated with some lack in the mathematics required to model complex systems in that data analysis would be at the epicentre and a key facilitator of some current integrative phase of

science it is all devoted to the question of representation in science whence its name image in action and main thrusts such a classification makes concepts as complexity or dynamics appear like transverse notions a measure among others or a dimensional feature among others part a broadly discusses a dialogue between experiments and information be information extracted from or brought to experiments the concept is fundamental in statistics and tailors to the emergence of collective behaviours communication then asks for uncertainty considerations noise indeterminacy or approximation and its wider impact on the couple perception action clustering being all about uncertainty handling data set representation appears not to be the only solution introducing hierarchies with adapted metrics a priori pre improving the data resolution are other methods in need of evaluation the technology together with increasing semantics enables to involve synthetic data as simulation results for the multiplication of sources part b plays with another couple important for complex systems state vs transition state first descriptions would characterize physics while transition first would fit biology that could stem from life producing dynamical systems in essence uncertainty joining causality here geometry can bring answers stable patterns in the state space involve constraints from some dynamics consistency stable patterns of activity characterize biological systems too in the living world the complexity i.e. a global measure on both states and transitions increases with consciousness this might be a principle of evolution beside geometry or measures operators and topology have supporters for reporting on dynamical systems eventually targeting universality the category theory of topological thermodynamics is proposed as a foundation of dynamical system understanding part c details examples of actual data system relations in regards to explicit applications and experiments it shows how pure computer display and animation techniques link models and representations to reality in some concrete virtual manner such techniques are inspired from artificial life with no connection to physical biological or physiological phenomena the virtual observatory is the second illustration of the evidence that simulation helps science not only in giving access to more flexible parameter variability but also due to the associated data and method storing capabilities it fosters interoperability statistics on bulky corpuses efficient data mining possibly through the web etc in short a reuse of resources in general including novel ideas and competencies other examples deal more classically with inverse modelling and reconstruction involving bayesian techniques or chaos but also fractal and symmetry

in the recent past new materials laboratory and in situ testing methods and construction techniques have been introduced in addition modern computational techniques such as the finite element method enable the utilization of sophisticated constitutive models for realistic model based predictions of the response of pavements the 7th rilem international conference on cracking of pavements provided an international forum for the exchange of ideas information and knowledge amongst experts involved in computational analysis material production experimental characterization design and construction of pavements all submitted contributions were subjected to an exhaustive refereed peer review procedure by the scientific committee the editors and a large group of international experts in the topic on the basis of their

recommendations 129 contributions which best suited the goals and the objectives of the conference were chosen for presentation and inclusion in the proceedings the strong message that emanates from the accepted contributions is that by accounting for the idiosyncrasies of the response of pavement engineering materials modern sophisticated constitutive models in combination with new experimental material characterization and construction techniques provide a powerful arsenal for understanding and designing against the mechanisms and the processes causing cracking and pavement response deterioration as such they enable the adoption of truly mechanistic design methodologies the papers represent the following topics laboratory evaluation of asphalt concrete cracking potential pavement cracking detection field investigation of pavement cracking pavement cracking modeling response crack analysis and damage prediction performance of concrete pavements and white toppings fatigue cracking and damage characterization of asphalt concrete evaluation of the effectiveness of asphalt concrete modification crack growth parameters and mechanisms evaluation quantification and modeling of asphalt healing properties reinforcement and interlayer systems for crack mitigation thermal and low temperature cracking of pavements and cracking propensity of wma and recycled asphalts

the early anglo saxon period is characterized archaeologically by the regular deposition of artefacts in human graves in england the scope for dating these objects and graves has long been studied but it has typically proved easier to identify and enumerate the chronological problems of the material than to solve them prior to the work of the project reported on here therefore there was no comprehensive chronological

framework for early anglo saxon archaeology and the level of detail and precision in dates that could be suggested was low the evidence has now been studied afresh using a co ordinated suite of dating techniques both traditional and new a review and revision of artefact typology seriation of grave assemblages using correspondence analysis high precision radiocarbon dating of selected bone samples and bayesian modelling using the results of all of these these were focussed primarily on the later part of the early anglo saxon period starting in the 6th century this research has produced a new chronological framework consisting of sequences of phases that are separate for male and female burials but nevertheless mutually consistent and coordinated these will allow archaeologists to assign grave assemblages and a wide range of individual artefact types to defined phases that are associated with calendrical date ranges whose limits are expressed to a specific degree of probability important unresolved issues include a precise adjustment for dietary effects on radiocarbon dates from human skeletal material nonetheless the results of this project suggest the cessation of regular burial with grave goods in anglo saxon england two decades or even more before the end of the seventh century that creates a limited but important discrepancy with the current numismatic chronology of early english sceattas the wider implications of the results for key topics in anglo saxon archaeology and social economic and religious history are discussed to conclude the report

design and implementation of service oriented architectures imposes a huge number of research questions from the fields of software engineering system analysis and modeling adaptability and application integration component orientation and web services are two approaches for design and realization of complex web based system both approaches allow for dynamic application adaptation as well as integration of enterprise application commonly used technologies such as j2ee and net form de facto standards for the realization of complex distributed systems evolution of component systems has lead to web services and service based architectures this has been manifested in a multitude of industry standards and initiatives such as xml wsdl uddi soap etc all these achievements lead to a new and

promising paradigm in it systems engineering which proposes to design complex software solutions as collaboration of contractually defined software services service oriented systems engineering represents a symbiosis of best practices in object orientation component based development distributed computing and business process management it provides integration of business and it concerns the annual ph d retreat of the research school provides each member the opportunity to present his her current state of their research and to give an outline of a prospective ph d thesis due to the interdisciplinary structure of the research scholl this technical report covers a wide range of research topics these include but are not limited to self adaptive service oriented systems operating system support for service oriented systems architecture and modeling of service oriented systems adaptive process management services composition and workflow planning security engineering of service based it systems quantitative analysis and optimization of service oriented systems service oriented systems in 3d computer graphics sowie service oriented geoinformatics
