the english edition contains a few differences from the first italian edition which require an explanation firstly some images especially some 3d reconstructions have been modified in order to make them clearer secondly in agreement with the publisher we have disowned one of our statements in the preface to the italian edition namely we have now added a brief introductory text for each section by way of explanation to the anatomical and physiological notes this should make it easier for the reader to understand and refer to this atlas these differences derive from our experience with the previous edition and are meant to be an improvement thereof hopefully there will be more editions to follow so that we may further improve our work and keep ourselves busy on lone some evenings finally the improvements in this edition are a reminder to the reader that one should never purchase the first edition of a work uaquila january 2006 the authors preface to the italian edition i have been meaning to publish an atlas of neuroradiologic cranio encephalic anatomy for at least the last decade normal anatomy has always been of great and charming interest to me over the years while preparing lectures for my students i have always enjoyed lingering on anatomical details that today are rendered with astonishing realism by routine diagnostic imaging

modern therapeutic strategies in the last decade have radically changed the approach to the oncologic patient with metastatic disease not infrequently today metastases are managed more aggressively and addressed in a multidisciplinary way with extremely encouraging results in terms of both survival and disease control there have been equally revolutionary changes in diagnostic imaging with renewed attention to early diagnosis of both local and distant recurrence in order to prompt timely radical intervention the distribution of metastases is affected by characteristics of the primary improved survival of neoplastic patients and the routine imaging follow up have resulted in greatly increased detection of metastatic malignancies with less than typical appearance and behaviour
