biology has inspired electronics from the very beginning the machines that we now call computers are deeply rooted in biological metaphors pioneers such as alan turing and john von neumann openly declared their aim of creating artificial machines that could mimic some of the behaviors exhibited by natural organisms unfortunately technology had not progressed enough to allow them to put their ideas into practice the 1990s saw the introduction of programmable devices both digital fpga and analogue fpaas these devices by allowing the functionality and the structure of electronic devices to be easily altered enabled researchers to endow circuits with some of the same versatility exhibited by

biological entities and sparked a renaissance in the field of bio inspired electronics with the birth of what is generally known as evolvable hardware ever since the field has progressed along with the technological improvements and has expanded to take into account many different biological processes from evolution to learning from development to healing of course the application of these processes to electronic devices is not always straightforward to say the least but rather than being discouraged researchers in the community have shown remarkable ingenuity as demonstrated by the variety of approaches presented at this conference and included in these proceedings

as the amount of information in biology expands dramatically it becomes increasingly important for textbooks to distill the vast amount of scientific knowledge into concise principles and enduring concepts as with previous editions molecular biology of the cell sixth edition accomplishes this goal with clear writing and beautiful illustrations the sixth edition has been extensively revised and updated with the latest research in the field of cell biology and it provides an exceptional framework for teaching and learning the entire illustration program has been greatly enhanced protein structures better illustrate structure function relationships icons are simpler and more consistent within and between chapters and micrographs have been refreshed and updated with newer clearer or better

images as a new feature each chapter now contains intriguing openended questions highlighting what we don t know introducing students to challenging areas of future research updated end of chapter problems reflect new research discussed in the text and these problems have been expanded to all chapters by adding questions on developmental biology tissues and stem cells pathogens and the immune system

the idea of evolving machines whose origins can be traced to the cybernetics movement of the 1940s and 1950s has recently resurged in the form of the nascent field of bio-inspired systems and evolvable hardware the inaugural workshop towards evolvable hardware took place in lausanne in october 1995 followed by the first international conference on evolvable systems from biology to hardware ices held in tsukuba japan in october 1996 the second ices conference was held in lausanne in september 1998 with the third and fourth being held in edinburgh april 2000 and tokyo october 2001 respectively this has become the leading conference in the field of evolvable systems and the 2003 conference promised to be at least as good as if not better than the four that preceded it the fifth international conference was built on the success of its predecessors aiming at presenting the latest developments in the field in addition it brought together researchers who use biologically inspired concepts to implement real systems in artificial intelligence artificial life robotics vlsi design and related domains we would say that this fifth conference followed on from the previous four in that it consisted of a number of high quality interesting thought provoking papers
