this paper studies alternative certification schemes for organic products in order to draw conclusions regarding the institutional support and technological development required for compliance with organic standards it discusses third party certification for both individuals and farmer groups as well as participatory certification case studies from developing countries and countries in transition engaged in organic rice and organic fruit and vegetable production are examined issues analysed include the organizational structure and marketing strategies in the organic supply chain the paper also discusses the institutional development that is needed to provide business and technical services and establish the quality assurance system organizational managerial and business skills required by the lead stakeholders in the organic chain are analysed as well as the costs that they incur for effectively managing organic projects similarly the managerial skills required at the farm level are considered as is the use of cost benefit analysis the paper also reviews the legal and institutional framework that facilitates organic production and certification the paper is aimed at staff of government private and non government organizations working at the policy level and in the field and at donors organizations that support organic production and certification

numerical methods provide a powerful and essential tool for the solution of problems of water resources this book gives an elementary introduction to the various methods in current use and demonstrates that different methods work well in different situations and some problems require combinations of methods it is essential to know something of all of them in order to make a reasoned judgement of current practice their applications are discussed and more specialised versions are outlined along with many references making this an invaluable comprehensive coverage of the field

what lessons can be drawn from the unprecedented growth and spectacular collapse of financial pyramid schemes in albania this paper discusses the origins of the pyramid schemes and the way the authorities handled them it also analyzes the economic effects of the pyramid schemes concluding that despite the descent into anarchy triggered by the schemes collapse their direct effects on the economy are difficult to specify and appear to have been limited finally the paper argues that prevention of pyramid schemes is better than cure and that governments and international financial institutions should be vigilant in clamping down on frauds

association schemes are of interest to both mathematicians and statisticians and this book was written with both audiences in mind for statisticians it shows how to construct designs for experiments in blocks how to compare such designs and how to analyse data from them the reader is only assumed to know very basic abstract algebra for pure mathematicians it tells why association schemes are important and develops the theory to the level of advanced research this book arose from a course successfully taught by the author and as such the material is thoroughly class tested there are a great number of examples and exercises that will increase the book's appeal to both graduate students and their instructors in organic spectrum from spectra fifth edition answers

subdivision is a way of representing smooth shapes in a computer a curve or surface both of which contain an infinite number of points is described in terms of two objects one object is a sequence of vertices which we visualise as a polygon for curves or a network of vertices which we visualise by drawing the edges or faces of the network for surfaces the other object is a set of rules for making denser sequences or networks when applied repeatedly the denser and denser sequences are claimed to converge to a limit which is the curve or surface that we want to represent this book focusses on curves because the theory for that is complete enough that a book claiming that our understanding is complete is exactly what is needed to stimulate research proving that claim wrong also because there are already a number of good books on subdivision surfaces the way in which the limit curve relates to the polygon and a lot of interesting properties of the limit curve depend on the set of rules and this book is about how one can deduce those properties from the set of rules and how one can then use that understanding to construct rules which give the properties that one wants

organic vegetable production provides an invaluable practical guide to the production of organic vegetables across a range of organic farming systems in temperate areas the book covers all aspects of production including crop choice fertility building and weed pest and disease management within a framework of rotation design and business planning the specific needs of a range of commonly grown vegetable crops are discussed in detail the authors consider that knowledge gathering marketing and financial management are integral parts of organic vegetable production and these subjects are examined in depth speciality topics as protected cropping and storage are covered the book highlights the technical and economic consequences of converting from conventional to organic production and the challenges that can arise

starting from january 1 2005 the european union will implement a scheme for trading with greenhouse gas ghg emission allowances during the first trading period 2005 2007 the scheme covers only co2 and there is no international commitment to reduce the emission of ghg during the second period 2008 2012 the european union has committed to reducing their emissions of ghg by 8 compared to 1990 levels emissions trading will create a cost of co2 emissions and increase the marginal cost of producing electricity in fossil fueled plants this will result in an increase in the electricity price for the period of 2005 2007 the likely range of allowance prices in the eu is estimated to be 1 5 tonne co2 and for 2008 2012 8 13 tonne co2 based on these estimates the effect on the price of electricity is analyzed in the short run the price increases in the nordic countries except jutland is less than the increase in marginal cost for coal plants in the somewhat longer run 2012 the price increase is approximately the same as the increase in the marginal cost of modern gas fired plants

during the last decade enormous progress has been achieved in the field of computational fluid dynamics this became possible by the development of robust and high order accurate numerical algorithms as well as the construction of enhanced computer hardware e g parallel and vector architectures workstation clusters all these improvements allow the numerical simulation of real world problems arising for instance in automotive and aviation industry nowadays numerical simulations may be considered as an indispensable tool in the design of engineering devices complementing or avoiding expensive experiments in order to obtain qualitatively as well as quantitatively reliable results the complexity of the applications continuously increases due to the demand of resolving more details of the real world configuration as well as taking better physical models into account e g turbulence real gas or aeroelasticity although the speed and memory of computer hardware are currently doubled approximately every 18 months according to moore's law this will not be sufficient to cope with the increasing complexity required by uniform discretizations the future task will be to optimize the utilization of the available resources therefore new numerical algorithms have to be developed with a computational complexity that can be termed nearly optimal in the sense that storage and computational expense remain proportional to the inherent complexity a term that will be made clearer later problem this leads to adaptive concepts which correspond in a natural way to unstructured grids

while a considerable amount of literature has been produced in the past decades on the overall experience of using partial credit guarantee schemes pcgs to overcome the credit gap in developing agriculture what is still lacking nowadays is a structured and rigorous empirical evidence demonstrating the concrete impact of pcgs specifically established to unlock financing for agricultural smes most case studies available today only provide a descriptive analysis of the results constraints and features of agriculture specific pcgs while lacking an impact evaluation approach either fully experimental or quasi non experimental whose findings could also be used to properly inform the design of future facilities and related policies this working paper has been developed to assist in overcoming the current gap in empirical data on the impact of agricultural pcgs by providing interested readers whether policymakers the academia development agencies or other stakeholders with key information on technical and operational aspects of impact evaluations of credit guarantee schemes in agriculture as well as recommendations on the feasibility of carrying out such evaluations with the aim of generating evidence on a more systematic basis the hope is that public stakeholders interested in carrying out a proper impact evaluation of an agriculture focused guarantee scheme can use the materials provided by this publication as a reference point for their work
