Design Manual

1968

the idaho national engineering and environmental laboratory ineel through the u s department of energy doe has proposed that a large scale wind test facility lswtf be constructed to study in full scale the behavior of low rise structures under simulated extreme wind conditions to determine the need for and potential benefits of such a facility the idaho operations office of the doe requested that the national research council nrc perform an independent assessment of the role and potential value of an lswtf in the overall context of wind engineering research the nrc established the committee to review the need for a large scale test facility for research on the effects of extreme winds on structures under the auspices of the board on infrastructure and the constructed environment to perform this assessment this report conveys the results of the committee s deliberations as well as its findings and recommendations

Facilities Data

1974

engine testing is a unique well organized and comprehensive collection of the different aspects of engine and vehicle testing equipment and infrastructure for anyone involved in facility design and management physical testing and the maintenance upgrading and trouble shooting of testing equipment designed so that its chapters can all stand alone to be read in sequence or out of order as needed engine testing is also an ideal resource for automotive engineers required to perform testing functions whose jobs do not involve engine testing on a regular basis this recognized standard reference for the subject is now enhanced with new chapters on hybrid testing obd on board diagnostics and sensor signals from modern engines one of few books dedicated to engine testing and a true recognized market leader on the subject covers all key aspects of this large topic including test cell design and setup data management and dynamometer selection and use with new chapters on hybrid testing obd on board diagnostics and sensor signals from modern engines brings together otherwise scattered information on the theory and practice of engine testing into one up to date reference for automotive engineers who must refer to such knowledge on a daily basis

White Sands Manned Spacecraft Center and Test Facility, Houston

1972

this book presents a collection of the latest studies on and applications for the sustainable development of urban energy systems based on the 20th international scientific conference on energy management of municipal facilities and sustainable energy technologies held in voronezh and samara russia from 10 to 13 december 2018 it addresses a range of aspects including energy modelling materials and applications in buildings heating ventilation and air conditioning systems renewable energy technologies photovoltaic biomass and wind energy electrical energy storage energy management and life cycle assessment in urban systems and transportation the book is intended for a broad readership from policymakers tasked with evaluating and promoting key enabling technologies efficiency policies and sustainable energy practices to researchers and engineers involved in the design and analysis of complex systems

Engineering Management of Design and Construction of Facilities of the National Aeronautics and Space Administration

1969

nowadays research in earthquake engineering is mainly experimental and in large scale advanced computations are integrated with large scale experiments to complement them and extend their scope even by coupling two different but simultaneous tests earthquake engineering cannot give answers by testing and qualifying few small typical components or single large prototypes besides the large diversity of civil engineering structures does not allow drawing conclusions from only a few tests structures are large and their seismic response and performance cannot be meaningfully tested in an ordinary lab or in the field so seismic testing facilities should be much larger than in other scientific fields their staff has to be resourceful devising intelligent ways to carry out simultaneously different tests and advanced computations to better serve such a mission european testing facilities and researchers in earthquake engineering have shared their resources and activities in the framework of the european project series combining their research and jointly developing advanced testing and instrumentation techniques that maximize testing capabilities and increase the value of the tests this volume presents the first outcomes of the series and its contribution towards performance based earthquake engineering i e to the most important development in earthquake engineering of the past three decades the concept and the methodologies for performance based earthquake engineering have now matured however they are based mainly on analytical numerical research large scale seismic testing has entered the stage recently the series workshop in ohrid mk in sept 2010 pooled together the largest european seismic testing facilities europe s best experts in experimental earthquake engineering and select experts from the usa to present recent research achievements and to address future developments audience this volume will be of interest to researchers and advanced practitioners in structural earthquake engineering geotechnical earthquake engineering engineering seismology and experimental dynamics including seismic qualification

Roswell Test Facility

1972

buildings influence people they account for one third of energy consumption across the globe and represent an annual capital expenditure of 7 10 of gnp in industrialized countries their lifetime operation costs can exceed capital investment building engineering aims to make buildings more efficient safe and economical one branch of this discipline building physics science has gained prominence with a heightened awareness of such phenomena as sick buildings the energy crisis and sustainability and considering the performance of buildings in terms of climatic loads and indoor conditions the book reflects the advanced level and high quality of research which building engineering and building physics science in particular have reached at the beginning of the twenty first century it will be a valuable resource to engineers architects building scientists consultants on the building envelope researchers and graduate students

Technical Facilities Catalog

1974

this report is a compilation of five progress reports describing design and construction work on the 2000 kw sodium test facility during the period from april 1 1958 through september 30 1959 the primary purpose of the sodium test facility project is to test models of equipment components which might ultimately be incorporated into a molten plutonium sodium cooled fast reactor
