the electrostatic equations look at what has happened for the static case but just for the static case maxwell s equations decouple into two independent sets of two equations the first set involves electric field \mathbf{E} and charge density ρ these are called the electrostatic equations in

the basic differential equations of electrostatics are $\nabla \cdot \mathbf{E} = \rho / \epsilon_0$ and $\nabla \times \mathbf{E} = 0$ where \mathbf{E} is the electric field and ρ is the electric charge density the field is defined by the statement that a charge q at point x experiences a force $\mathbf{F} = q\mathbf{E}$ where \mathbf{E} is the field produced by all charges other than q itself

potential energy of a system of 3 charges khan academy

Jan 13 2023

to calculate the electrostatic potential energy of a system of charges we find the total work done by the external agent in assembling those charges since electrostatic fields are conservative the work done is path independent and so we can assemble the charges one by one and calculate the work done in each step and them together
