Integrated Design and Simulation of Chemical Processes 2014-09-18 computing systems are undergoing a transformation from logic centric towards memory centric architectures where overall performance and energy efficiency at the system level are determined by the density performance functionality and efficiency of the memory rather than the logic sub system this is driven by the requirements of data intensive applications in artificial intelligence autonomous systems and edge computing we are at an exciting time in the semiconductor industry where several innovative device and technology concepts are being developed to respond to these demands and capture shares of the fast growing market for ai related hardware this special issue is devoted to highlighting discussing and presenting the latest advancements in this area drawing on the best work on emerging memory devices including magnetic resistive phase change and other types of memory the special issue is interested in work that presents concepts

ideas and recent progress ranging from materials to memory devices physics of switching mechanisms circuits and system applications as well as progress in modeling and design tools contributions that bridge across several of these layers are especially encouraged
