

The Software Encyclopedia

1985

Computer software is a collection of instructions that tell a computer what to do. It is the program that controls the hardware and makes it work. Software is essential for the operation of any computer system. It is the brain of the machine, and without it, the computer would be useless. Software is created by programmers who write code that the computer can understand and execute. This code is then compiled into a form that the computer can use. The software is then installed on the computer and can be used to perform a variety of tasks, from simple word processing to complex scientific calculations. Software is constantly evolving, and new programs are being developed all the time to meet the needs of a constantly changing world.
