Plants 2019-01-10

plants are frequently exposed to unfavorable and adverse environmental conditions known as abiotic stressors these factors can include salinity drought heat cold flooding heavy metals and uv radiation which pose serious threats to the sustainability of crop yields since abiotic stresses are major constraints for crop production finding the approaches to enhance stress tolerance is crucial to increase crop production and increase food security this book discusses approaches to enhance abiotic stress tolerance in crop plants on a global scale plants scientists and breeders will learn how to further mitigate plant responses and develop new crop varieties for the changing climate

the sustainable governance of water resources relies on processes of multi stakeholder collaborations and interactions that facilitate knowledge co creation and social learning governance systems are often fragmented forming a barrier to adequately addressing the myriad of challenges affecting water resources including climate change increased urbanized populations and pollution transitions towards sustainable water governance will likely require innovative learning partnerships between public private and civil society stakeholders it is essential that such partnerships involve vertical and horizontal communication of ideas and knowledge and an enabling and democratic environment characterized by informal and open discourse there is increasing interest in learning based transitions thus far much scholarly thinking and to a lesser degree empirical research has gone into understanding the potential impact of social learning on multi stakeholder settings the question of whether such learning can be supported by forms of serious gaming has hardly been asked this special issue critically explores the potential of serious games to support multi stakeholder social learning and collaborations in the context of water governance serious games may involve

as the rates of chronic diseases like diabetes asthma and obesity skyrocket research is showing that the built environment the way our cities and towns are developed contributes to the epidemic rates of these diseases it is unlikely that those who planned and developed these places envisioned these situations public health community development planning and other fields influencing the built environment have operated in isolation for much of recent history with the result being places that public health advocates have labelled designed for disease the sad irony of this is that planning and public health arose together in response to the need to create health standards zoning and building codes to combat the

conventional food safety and quality research have traditionally dealt with the whole organism or food product either plant or animal or with the microorganisms that associate with these food producing plants and animals at various stages of growth development and maturation however conventional research methods no longer are sufficient to bring about the improvements in quality and safety of foods that are demanded in today's marketplace by increasingly educated and sophisticated consumers improved quality has generally been thought to mean 1 unblemished products particularly fruits and vegetables and 2 the desired functionality of protein carbohydrates and fats in grain oilseeds and the like to achieve the intended purpose in processing foods for example dough characteristics to make bread or pasta however it also means the year round ready availability of nutritious and appealing choices in all food groups that can be quickly and easily prepared this promotes optimum nutrition particularly necessary in children the elderly and special needs groups and it allows health conscious consumers to match their calorie intake with individual needs to achieve and
