accessing remote instrumentation worldwide is one of the goals of e science the task of enabling the execution of complex experiments that involve the use of distributed scientific instruments must be supported by a number of different architectural domains which inter work in a coordinated fashion to provide the necessary functionality these domains embrace the physical instruments the communication network interconnecting the distributed systems the service

oriented abstractions and their middleware the grid paradigm or more generally the service oriented architecture soa viewed as a tool for the integration of distributed resources plays a significant role not only to manage computational aspects but increasingly as an aggregator of measurement instrumentation and pervasive large scale data acquisition platforms in this context the functionality of a soa allows managing maintaining and exploiting heterogeneous instrumentation and acquisition devices in a unified way by providing standardized interfaces and common working environments to their users but the peculiar aspects of dealing with real instruments of widely different categories may add new functional requirements to this scenario on the other hand the growing transport capacity of core and access networks allows data transfer at unprecedented speed but new challenges arise from wireless access wireless sensor networks and the traversal of heterogeneous network domains the book focuses on all aspects related to the effective exploitation of remote instrumentation and to the building complex virtual laboratories on top of real devices and infrastructures these include soa and related middleware high speed networking in support of grid applications wireless grids for acquisition devices and sensor networks quality of service qos provisioning for real time control measurement instrumentation and methodology as well as metrology issues in distributed systems

the origin of this book goes back to the dagstuhl seminar on logic for system engineering organized during the first week of march 1997 by s jihhnicen j loeckx and m wirsing during that seminar after egon borger s talk on how to use abstract state machines in software engineering wolfram schulte at the time a research assistant at the university of ulm germany questioned whether asms provide anything special as a scientifically well founded and rigorous yet simple and industrially viable framework for high level design and analysis of complex systems and for natural refinements of models to executable code wolfram schulte argued referring to his work with k achatz on a formal object oriented method inspired by fusion and object z 1 that with current techniques of functional programming and of axiomatic specification one can achieve the same result an intensive and long debate arose from this discussion at the end of the week it led egon borger to propose a collaboration on a real life specification project of wolfram schulte s choice as a comparative field test of purely functional declarative methods and of their enhancement within an integrated abstract state based operational asm approach after some hesitation in may 1997 wolfram schulte accepted the offer and chose as the theme a high level specification of java and of the java virtual machine
