this book is an edited volume the goal of which is to provide an overview of the current state of the art in statistical methods applied to problems in structural bioinformatics and in particular protein structure prediction simulation experimental structure determination and analysis it focuses on statistical methods that have a clear interpretation in the framework of statistical physics rather than ad hoc black box methods based on neural networks or support vector machines in addition the emphasis is on methods that deal with biomolecular structure in atomic detail the book is highly accessible and only assumes background knowledge on protein structure with a minimum of mathematical knowledge therefore the book includes introductory chapters that contain a solid introduction to key topics such as bayesian statistics and concepts in machine learning and statistical physics
