professional development is often determined by black and white thinking either issues are considered as being good or bad or statements like teachers should or teachers must are transported however it is easily forgotten from which perspective the judgment is taken surely it is not the teacher s one profoundly respecting and

cherishing the teachers and their needs allows for arriving at a vision of professional development that is for and with teachers instead being simply about them this book presents the field of mathematics teacher professional development both from a theoretical and an empirical perspective in particular the initiative mathematics done differently that has been run in germany is presented in whose context the data of the empirical study was gathered the empirical findings led to postulating a model describing teachers individual growth pathways and to providing implications for constructing practices that are based on what teachers really need

like most areas of scholarship mathematics is a cumulative discipline new research is reliant on well organized and well curated literature because of the precise definitions and structures within mathematics today s information technologies and machine learning tools provide an opportunity to further organize and enhance discoverability of the mathematics literature in new ways with the potential to significantly facilitate mathematics research and learning opportunities exist to enhance discoverability directly via new technologies and also by using technology to capture important interactions between mathematicians and the literature for later sharing and reuse developing a 21st century global library for mathematics research discusses how information about what the mathematical literature contains can be formalized and made easier to express encode and explore many of the tools necessary to make this information system a reality will require much more than indexing and will instead depend on community input paired with machine learning where mathematicians expertise can fill the gaps of automatization this report proposes the establishment of an organization the development of a set of platforms tools and services the deployment of an ongoing applied research program to complement the development work and the mobilization and coordination of the mathematical community to take the first steps toward these

capabilities the report recommends building on the extensive work done by many dedicated individuals under the rubric of the world digital mathematical library as well as many other community initiatives developing a 21st century global library for mathematics envisions a combination of machine learning methods and community based editorial effort that makes a significantly greater portion of the information and knowledge in the global mathematical corpus available to researchers as linked open data through a central organizational entity referred to in the report as the digital mathematics library this report describes how such a library might operate discussing development and research needs role in facilitating discover and interaction and establishing partnerships with publishers

early childhood mathematics is vitally important for young children s present and future educational success research demonstrates that virtually all young children have the capability to learn and become competent in mathematics furthermore young children enjoy their early informal experiences with mathematics unfortunately many children s potential in mathematics is not fully realized especially those children who are economically disadvantaged this is due in part to a lack of opportunities to learn mathematics in early childhood settings or through everyday experiences in the home and in their communities improvements in early childhood mathematics education can provide young children with the foundation for school success relying on a comprehensive review of the research mathematics learning in early childhood lays out the critical areas that should be the focus of young children s early mathematics education explores the extent to which they are currently being incorporated in early childhood settings and identifies the changes needed to improve the quality of mathematics experiences for young children this book serves as a call to action to improve the state of early childhood mathematics it will be especially useful for policy makers and practitioners those who work directly with children and their families in shaping the policies that affect the education of young children

why a book on gender issues in mathematics in the 21st century several factors have influenced the undertaking of this project by the editors first an international volume focusing on gender and mathematics has not appeared since publication of papers emerging from the 1996 international congress on mathematical education keitel 1998 surely it was time for an updated look at this critical area of mathematics education second we have had lively discussion and working groups on gender issues at conferences of the international group for the psychology of mathematics education pme for the past four years sessions at which stimulating and ground breaking research has been discussed by participants from many different countries some publication seemed essential to share this new knowledge emerging from a wider variety of countries and from different cultural perspectives third some western countries such as australia and the usa have experienced in recent years a focus on the boy problem with an underlying assumption that issues of females and mathematics have been solved and are no longer worthy of interest

thus it seemed timely to look more closely at the issue of gender and mathematics internationally when the idea for this volume first emerged invitations were issued to those regularly attending the working and discussion groups at pme potential authors were charged to focus on gender issues in mathematics and were given wide scope to hone in on the issues that were central to their own research efforts or were in receipt or in need of close attention in their own national or regional contexts

efforts to improve mathematics education have led educators and researchers to not only study the nature of proficiency beliefs and practices in mathematics learning and teaching but also identify and assess possible influences on students and teachers' proficiencies, beliefs, and practices in learning and teaching mathematics. The complexity of these topics has fascinated researchers from various backgrounds, including psychologists, cognitive or learning scientists, mathematicians, and mathematics educators. Among those researchers, two scholars with a similar background, Alan Schoenfeld in the United States and Günter Törner in Germany, are internationally recognized for their contributions to these topics. To celebrate their 65th birthdays in 2012, this book brought together many scholars to reflect on how their own work has built upon and continued Alan and Günter's work in mathematics education. The book contains 17 chapters by 33 scholars from six different education systems. This collection describes recent research and provides new insights into these topics of interest to mathematics educators, researchers, and graduate students who wish to learn about the trajectory and direction of research on these issues.

As computers and communications technology advance, greater opportunities arise for intelligent mathematical computation. While computer algebra, automated deduction, and mathematical publishing each have long and successful histories, we are now seeing increasing opportunities for synergy among them. The conferences on intelligent computer mathematics (CICM) 2009 is a collection of co-located meetings allowing researchers and practitioners active in these related areas to share recent results and identify the next challenges. The specific areas of the CICM conferences and workshops are described below, but the unifying theme is the computerized handling of mathematical knowledge. The successful formalization of much of mathematics, as well as a better understanding of its internal structure, makes mathematical knowledge in many ways more tractable than general knowledge as traditionally treated in artificial intelligence. Similarly, we can also expect the problem of effectively using mathematical knowledge in automated ways to be much more tractable. This is the goal of the work in the CICM conferences and workshops. In the long view, solving the problems addressed by CICM is an important milestone in formulating the next generation of mathematical software.
