john stewart bell 1928 1990 was one of the most important figures in twentieth century physics famous for his work on the fundamental aspects of the century s most important theory quantum mechanics while the debate over quantum theory between the supremely famous physicists albert einstein and niels bohr appeared to have become sterile in the 1930s bell was able to revive it and to make crucial advances bell s theorem or bell s inequalities he was able to demonstrate a contradiction between quantum theory and essential elements of pre quantum theory locality and causality the book gives a non mathematical account of bell s relatively impoverished upbringing in belfast and his education it describes his major contributions to quantum theory but also his important work in the physics of accelerators and nuclear and elementary particle physics

the papers in this volume represent most of the contributions to the symposium on the physics of optoelectronic materials held at the general motors research laboratories in warren michigan on october 4 5 and 6 1970 the purpose of this symposium was to examine the current status of knowledge related to the controlled alteration of the optical properties of solids through externally applied agencies with the aim of assessing possible future directions of scientific effort to achieve efficient practical control of light since the advent of the laser the scientific community has been motivated to explore with a renewed vigor methods of modulating light and in the last decade several applications of the electrooptic effect in single crystal solids have been realized during this same period of time the list of recognized optical modulation effects in solids exclusive of the ordinary electrooptic effects has grown rapidly and recently dramatic demonstrations of light modulation by liquid crystal and ferroelectric ceramic materials have captured the attention of the scientific community unlike the single crystal electrooptic effects which are quite suitable for modulation of coherent laser light these latter materials promise relatively inexpensive approaches to the modulation of light from ordinary incoherent light sources it was these new vistas of light modulation and how they fit into our current understanding of the optical properties of solids that the symposium addressed

we could be on the threshold of a scientific revolution quantum mechanics is based on unique finite and discrete events general relativity assumes a continuous curved space time reconciling the two remains the most fundamental unsolved scientific problem left over from the last century the papers of h pierre noyes collected in this volume reflect one attempt to achieve that unification by replacing the continuum with the bit string events of computer science three principles are used physics can determine whether two quantities are the same or different measurement can tell something from nothing this structure modeled by binary addition and multiplication can leave a historical record consisting of a growing universe of bit strings this book is specifically addressed to those interested in the foundations of particle physics relativity quantum mechanics physical cosmology and the philosophy of science
