the covid 19 pandemic drastically transformed the classroom by keeping students and teachers apart for the sake of safety as schools emptied remote learning rapidly expanded through online services and video chatrooms unfortunately this disrupted many students and teachers who were not accustomed to remote classrooms this challenge has forced k 12 teachers to think differently about teaching unexpectedly and with little time to prepare they have been confronted with redesigning their curriculum and instruction from face to face to online virtual

classrooms to protect students from the covid 19 virus while ensuring that these new online initiatives remain sustainable and useful in the post pandemic world as teachers learn to take advantage of the affordances and strengths of the multiple technologies available for virtual classroom instruction their instruction both in online and face to face will impact what and how students learn in the 21st century the handbook of research on transforming teachers online pedagogical reasoning for engaging k 12 students in virtual learning examines the best practices and pedagogical reasoning for designing online strategies that work for k 12 virtual learning the initial section provides foundational pedagogical ideas for constructing engaging virtual learning environments that leverage the unique strengths and opportunities while avoiding the weaknesses and threats of the online world the following chapters present instructional strategies for multiple grade levels and content areas best practices that work clearly describing why they work and the teachers pedagogical reasoning that supports online implementations the chapters provide ways to think about teaching in virtual environments that can be used to guide instructional strategy choices and recognizes the fundamental differences between face to face and

virtual environments as an essential design component covering such topics as k 12 classrooms pedagogical reasoning and virtual learning this text is perfect for professors teachers students educational designers and developers instructional technology faculty distance learning faculty and researchers interested in the subject

introduction to linear control systems is designed as a standard introduction to linear control systems for all those who one way or another deal with control systems it can be used as a comprehensive up

to date textbook for a one semester 3 credit undergraduate course on linear control systems as the first course on this topic at university this includes the faculties of electrical engineering mechanical engineering aerospace engineering chemical and petroleum engineering industrial engineering civil engineering bio engineering economics mathematics physics management and social sciences etc the book covers foundations of linear control systems their raison detre different types modelling representations computations stability concepts tools for time domain and frequency domain analysis and synthesis and fundamental limitations with an emphasis on frequency domain methods every chapter includes a part on further readings where more advanced topics and pertinent references are introduced for further studies the presentation is theoretically firm contemporary and self contained appendices cover laplace transform and differential equations dynamics matlab and simulink treatise on stability concepts and tools treatise on routh hurwitz method random optimization techniques as well as convex and non convex problems and sample midterm and endterm exams the book is divided to the sequel 3 parts plus appendices part i in this part of the book chapters 1 5 we present foundations of linear control systems this includes the introduction to control systems and

their raison detre their different types modelling of control systems different methods for their representation and fundamental computations basic stability concepts and tools for both analysis and design basic time domain analysis and design details and the root locus as a stability analysis and synthesis tool part ii in this part of the book chapters 6 9 we present what is generally referred to as the frequency domain methods this refers to the experiment of applying a sinusoidal input to the system and studying its output there are basically three different methods for representation and studying of the data of the aforementioned frequency response experiment these are the nyquist plot the bode diagram and the krohn manger nichols chart we study these methods in details we learn that the output is also a sinusoid with the same frequency but generally with different phase and magnitude by dividing the output by the input we obtain the so called sinusoidal or frequency transfer function of the system which is the same as the transfer function when the laplace variable s is substituted with finally we use the bode diagram for the design process part iii in this part chapter 10 we introduce some miscellaneous advanced topics under the theme fundamental limitations which should be included in this undergraduate course at least and

introductory level we make bridges between some seemingly disparate aspects of a control system and theoretically complement the previously studied subjects appendices the book contains seven appendices appendix a is on the laplace transform and differential equations appendix b is an introduction to dynamics appendix c is an introduction to matlab including simulink appendix d is a survey on stability concepts and tools a glossary and road map of the available stability concepts and tests is provided which is missing even in the research literature appendix e is a survey on the routh hurwitz method also missing in the literature appendix f is an introduction to random optimization techniques and convex and non convex problems finally appendix g presents sample midterm and endterm exams which are class tested several times
