the moors of the peak district provide some of the finest walking country in england the pleasure of rambling across them is enhanced by a knowledge of their history ranging from prehistoric times and the middle ages to their conversion for grouse shooting and the struggle for the right to roam in modern times this distinctive landscape is not an untouched natural relic for it has been shaped by humans over the centuries now it is being conserved as part of britain s first national park much of it is in the care of the national trust the book covers all periods of time from prehistory to the present for a

typical moorland walk might take in the standing stones of a prehistoric stone circle a medieval boundary marker a guide stoop dated 1709 the straight walls of nineteenth century enclosure a row of victorian grouse butts a long line of flagstones brought in by helicopter and very much more besides some of this physical evidence remains puzzling but most of it can be explained by assiduous research in local record offices the author has not referenced the documents as that would have made the book twice as long but the bibliography provides leads to where the information may be found as featured in the buxton advertiser buxton today and peak courier

does the earth contain enough oil to provide energy for the human race indefinitely if not how long will the oil last what about renewable energy technologies like wind and solar will they be able to supply an indefinite supply of energy for the human race if not how long will it last and what role does overpopulation play in our world s energy supply even with multiple forms of energy available how long will it last as long as more and more humans and therefore more industries and energy consumption are added taking a long held theory called peak oil theory the authors of this groundbreaking new text examine the theory of peak energy to examine all of these questions crude oil and natural gas are the major sources of fuel used to supply energy for various needs users of crude oil and natural gas must take into account that these energy sources are without doubt non renewable depleting resources and the cost of extraction depends not only on the current rate of production but also on the amount of cumulative production in fact many pundits believe projections that the world is rapidly approaching a precipice after which crude oil and natural gas will no longer be in ready supply this phenomenon has given rise to the peak oil theory peak oil is the point in time when the maximum rate of petroleum recovery from the reservoir is reached after which the rate of petroleum production enters terminal decline from this concept has emerged the wider concept of the peak energy theory which as it is related to the availability of all fossil fuels is also subject to decline with fossil fuel use this text written by two of the world s most well known respected and prolific writers in the energy industry is a fascinating study of our world s energy needs and the future of the multi source energy supply on this planet whether oil and gas wind solar geothermal or even nuclear all sources of energy have their limits and we as scientists engineers and consumers of energy need to be knowledgeable on these topics this book is a must have for any engineer student scientist or even layperson interested in energy and the idea of energy sustainability on planet earth

this book is as relevant today as it was when it was published in 1983 we are faced with another global depression which as it deepens intensifies the pressure on governments and puts policy makers in a dilemma every prescription has its negative monetarism unemployment keynesianism inflation and the planned economy authoritarianism this dilemma the author argues stems from a distortion in our understanding of how the industrial economy works a distortion he traces back to adam smith adam smith provided the captains of industry with a theoretical framework and moral justification for the new mode of production which sprang from the industrial revolution he believed he was setting out the rules for a free market system but inconsistently he granted landowners an exemption enabling them to exert a monopoly influence on the market which remains to this day the marxist critique blames the capitalist for the ills of the system yet marx himself acknowledged that the power of the owners of capital rested on the power inherent in land both marx and smith recognized the special role of landowners who in the words of j s mill grow richer in their sleep without working risking or economizing but neither pursued the macro economic implications and if anything covered them up the author looks at the implications the conflict between labour and capital is a false one that obstructs a rational strategy for rescuing the western economy the origins of the collapse of the 1980s are to be found in land speculation this exploitation of the unique power intrinsic to land gives rise to inner city decay urban sprawl misallocation of resources mass unemployment and the meteoric rise of property values the major industrial nations entered the 1990s in the midst of land booms offering riches for a few but unemployment for many banks in texas were bankrupted by massive speculation in real estate and even embassies had to abandon their offices because they could not afford the rents in tokyo in britain the spoils from housing the direct result of the way the land market operates have enriched owner occupiers but crippled the flow of workers into regions where entrepreneurs wanted to invest and lead the economy back to full employment thus it is the author s thesis that land speculation is the major cause of depressions he shows how the land market functions to distort the relations between labour and capital and how land speculation periodically chokes off economic expansion causing stagnation the remedy proposed by the author is a fiscal one which would remove the disruptive factor of land speculation and transfer the burden of taxes from labour and capital to economic rent a publicly created revenue this would create employment and higher growth rates while avoiding the inflation risk policy of deficit financing increased consumption and investment would be generated by the private sector not government
