during the last four decades remarkable developments have taken place in instrumentation and techniques for characterizing the microstructure and microcomposition of materials some of the most important of these instruments involve the use of electron beams because of the wealth of information that can be obtained from the interaction of electron beams with matter the principal instruments include the scanning electron microscope electron probe x ray microanalyzer and the analytical transmission electron microscope the training of students to use these instruments and to apply the new techniques that are possible with them is an important function which has been carried out by formal classes in universities and colleges and by special summer courses such as the ones offered for the past 19 years at lehigh university laboratory work which should be an integral part of such courses is often hindered by the lack of a suitable laboratory workbook while laboratory workbooks for transmission electron microscopy have been in existence for many years the broad range of topics that must be dealt with in scanning electron microscopy and microanalysis has made it difficult for instructors to devise meaningful experiments the present workbook provides a series of fundamental experiments to aid in hands on learning of the use of the instrumentation and the techniques it is written by a group of eminently qualified scientists and educators the importance of hands on learning cannot be overemphasized

this volume is based on papers presented at the international symposium on x ray microscopy held at brookhaven national laboratory upton ny august 31 september 4 1987 previous recent symposia on the sub ject were held in new york in 1979 gottingen in 1983 and taipei in 1986 developments in x ray microscopy continue at a rapid pace with im portant advances in all major areas x ray sources optics and components and microscopes and imaging systems taken as a whole the work pre sented here emphasizes three major directions a

improvements in the capability and image quality of x ray microscopy expressed principally in systems attached to large high brightness x ray sources b greater access to x ray microscopy expressed chiefly in systems employing small often pulsed x ray sources and c increased rate of exploration of applications of x ray microscopy the number of papers presented at the symposium has roughly doubled compared with that of its predecessors while we are delighted at this growth as a manifestation of vitality and rapid growth of the field we did have to ask the authors to limit the length of their papers and to submit them in camera ready form we thank the authors for their contributions and for their efforts in adhering to the guidelines on manuscript preparation

this book offers a description of current and recently developed laboratory assays in the field of haemostasis and thrombosis it is the result of a unique cooperation between experts from more than 60 institutes in 12 european countries brought together by the eca t european concerted action on thrombosis and disabilities under the auspices of the commission of the european communities in brussels belgium the ecat which was initiated in 1981 designed and performed three prospective clinical studies to establish haemostatic factors as risk indicators of thrombosis included were patients with angina pectoris at risk from myocardial infarction patients undergoing angioplasty at risk from re stenosis and patients receiving hip replacement at risk from deep venous thrombosis assay procedures were chosen training courses for technicians held and essential reagents were supplied from a central source a quality control assessment scheme served to compare assay results both within and between laboratories in the angina pectoris study centres determined most of the assays locally in the other two studies assays were performed centrally the need for further quality assessment in europe dr j f davidson in glasgow led to a separate activity coordinated by including coagulation inhibitors and plasminogen as risk factors for familial venous thrombosis the editors hope the eca t assay procedures book will contribute to further harmonization of haemostasis assays and ultimately to their standardization

this special issue of corrosion engineering science and technology is dedicated to the study of corrosion of objects from historical sites the issue contains contributions from the 2009 eurocorr session on corrosion of archaeological and heritage artefacts organised by the european federation of corrosion s working party and commissioned articles on other key issues the objective is to give the reader a broad understanding of corrosion of ancient materials for the most part metal but also glass articles shed light on a range of analytical approaches related to the study of the complex systems that make up historical artifacts in order to arrive at an understanding of the nanometric organisation of rust layers and interphases such studies must be approached on a macroscopic scale techniques used include macrophotography synchrotron radiation and transmission electron microscopy tem that ensure results that are both exhaustive and representative of particular observations this issue demonstrates the wealth of approaches possible in the study of the corrosion of ancient materials
