Hadzic's Textbook of Regional Anesthesia and Acute Pain Management, Second Edition 2013-03-12 in 1981 the institute of anesthesiology at the ludwig maximil ian university of munich organized a first international symposium on inhalation anesthetics in 1982 the most important contributions were published in the series anaesthesiology and intensive care medicine at that time the interest of european anesthesiologists was focused on isoflurane which had just been introduced for clinical purposes studies on this product had already been appearing for years in the american literature this book deals once more with all three inhalation anesthetics but places particular emphasis on isoflurane in contrast to the situation in 1981 extensive experimental and clinical investigations on isoflurane have by now become available in the european literature from its conception the objective of this symposium was not to discuss the relative value of inhalation anesthesia balanced anesthesia as compared with intravenous anesthesia on the contrary the major effects and interactions of isoflurane were to be explored the side effects and their relative significance in different patient groups were also of interest current knowledge concerning a range of topics related to inhalation anesthetics especially isoflurane was to be presented in a comprehensive and critical manner the effects of isoflurane on the cardiovascular system were the focus of interest during the symposium and are accordingly dealt with extensively in this volume the comparative effects on coronary perfusion of isoflurane enflurane and halothane are described

in detail

**Anesthesiology Core Review: Part One: BASIC Exam, Second Edition** 2016 in the past ten years full scale simulation training has become dramatically more evident in undergraduate and graduate medical education this increase has been due primarily to two factors the development of new computer driven technology and an interest in simulation specific training techniques technologically simulators have evolved from simple anatomical reproductions to full scale accurate reproductions of anatomy and physiology powered by multiple computers high technology simulation centers run by teams of faculty are emerging as integral tools in fulfilling medical centers educational missions in addition educational techniques specific to simulation which have been developed and used by other industries for over half a century are being applied to medical training aviation and aerospace have used sophisticated simulation since the 1950s to train pilots and astronauts extrapolating these methods for use in the medical world has been a natural course of events particularly in specialties that require some of the same basic thought processes and interactions required of the pilot or astronaut it is not surprising then that anesthesiology would be the medical specialty to take the lead in adding simulation training to its educational programs the anesthesiologist's job in the operating room is similar to that of a pilot in a cockpit not in the specific tasks but in decision making technological and human interfaces and crisis management
