this book integrates the concepts of big data analytics into mental health practice and research mental disorders represent a public health challenge of staggering proportions according to the most recent global burden of disease study psychiatric disorders constitute the leading cause of years lost to disability the high morbidity and mortality related to these conditions are proportional to the potential for overall health gains if mental disorders can be more effectively diagnosed and treated in order to fill these gaps analysis in science industry and government seeks to use big data for a variety of problems including clinical outcomes and diagnosis in psychiatry multiple mental healthcare providers and research laboratories are increasingly using large data sets to fulfill their mission briefly big data is characterized by high volume high velocity variety and veracity of information and to be useful it must be analyzed interpreted and acted upon as such focus has to shift to new analytical tools from the field of machine learning that will be critical for anyone practicing medicine psychiatry and behavioral sciences in the 21st century big data analytics is gaining traction in psychiatric research being used to provide predictive models for both clinical practice and public health systems as compared with traditional statistical methods that provide primarily average group level results big data analytics allows predictions and stratification of clinical outcomes at an individual subject level personalized psychiatry big data analytics in mental health provides a unique opportunity to showcase innovative solutions tackling complex problems in mental health using big data and machine learning it represents an interesting platform to work with key opinion leaders to document current achievements introduce new concepts as well as project the future role of big data and machine learning in mental health □□□□□□□□□□□□□□□□□□□□□□□□□ arising from startup research a stimulating research experience in which twenty eight early career researchers collaborated with seven senior international professors in order to develop novel statistical methods for complex brain imaging data during this meeting which was held on june 25 27 2017 in siena italy the research groups focused on recent multimodality imaging datasets measuring brain function and structure and proposed a wide variety of methods for network analysis spatial inference graphical modeling multiple testing dynamic inference data fusion tensor factorization object oriented analysis and others the results of their studies are gathered here along with a final contribution by michele guindani and marina vannucci that opens new research directions in this field the book offers a valuable resource for all researchers in data science and neuroscience who are interested in the promising intersections of these two fundamental disciplines reprint of the original
