this book is devoted to the problems of construction and application of chi squared goodness of fit tests for complete and censored data classical chi squared tests assume that unknown distribution parameters are estimated using grouped data but in practice this assumption is often forgotten in this book

we consider modified chi squared tests which do not suffer from such a drawback the authors provide examples of chi squared tests for various distributions widely used in practice and also consider chi squared tests for the parametric proportional hazards model and accelerated failure time model which are widely used in reliability and survival analysis particular attention is paid to the choice of grouping intervals and simulations this book covers recent innovations in the field as well as important results previously only published in russian chi squared tests are compared with other goodness of fit tests such as the cramer von mises smirnov anderson darling and zhang tests in terms of power when testing close competing hypotheses
