Biologically Inspired Approaches to Advanced Information Technology

2003-01-01

the evolution of the internet has led us to the new era of the information infrastructure as the information systems operating on the internet are getting larger and more complicated it is clear that the traditional approaches based on centralized mechanisms are no longer meaningful one typical example can be found in the recent growing interest in a p2p peer to peer computing paradigm it is quite different from the based client server systems which adopt essentially centralized management mechanisms the p2p computing environment has the potential to overcome bottlenecks in computing paradigm but it introduces another difficulty a scalability problem in terms of information found if we use a brute force flooding mechanism as such conventional information systems have been designed in a centralized fashion as the internet is deployed on a world scale however the information systems have been growing and it becomes more and more difficult to ensure fau free operation this has long been a fundamental research topic in the field a complex information system is becoming more than we can manage for these reasons there has recently been a significant increase in interest in biologically inspired approaches to designing future information systems that can be managed efficiently and correctly
