this book describes the state of the art use of biological insulating liquids in detail in recent years more and more transformers filled with esters have been put into operation this is because people recognize the benefits of ester liquids in terms of their fire safety high flash and fire points and environmental characteristics judging from their biodegradability their low co2 footprint only valid for natural ester and their beneficial interactions with solid insulation etc one of the main reasons is that the water adsorption and absorption characteristics of these liquids are excellent and very different compared to mineral oil the today s discussion about climate change and global warming is an additional driver for using natural ester another advantage is that transformers filled with biological insulating liquids can operate with an overload of up to 150 this is advantageous in the case of volatile energy generation from wind and solar power and in the supply of electrical energy for electromobility liquid inside electrical equipment is the lifeblood that serves both as a dielectric and a cooling medium some properties of these liquids differ from mineral oil which had to be considered in the transformer design the dielectric liquid is always in direct contact with transformer materials therefore the interaction should be very well understood especially when retrofilling an existing mineral oil filled device there are several natural ester fluids derived from various seeds and fruits on the market and their properties may differ more or less in the book the most important properties of the different biological insulating fluids and mineral oil are compared ester fluids have already found their way into various standards the condition of the device can be verified very well from the contents of the insulating liquids for analysis and testing the same equipment and devices that are commonly used for mineral oil are used for ester liquid the chemical and physical behaviors of ester fluids compared to mineral oil are different this must always be considered when interpreting test results stemming from ester fluids the book is a guideline for students original equipment manufacturers users laboratories and authorities in the use of biological insulating liquids

Environmental Impacts on Underground Power Distribution

the testing of unsaturated soils requires greater care and effort than that of saturated soils although unsaturated soil mechanics has been embraced by geotechnical engineering engineering practice has not yet caught up as the characterization of unsaturated soils is difficult and time consuming and made harder still by a lack of standards laboratory tests for unsaturated soils collates test procedures to cover all laboratory tests for characterising unsaturated soils it covers the background theory test procedures and interpretation of test results each test procedure is broken down into simple stages and described in detail the pitfalls of each test and the interpretation of the test results are explained test data and calculation methods are given along with many numerical examples to illustrate the methods of interpretation and to offer the presentation of typical results the book is especially useful for students and researchers who are new to the field and provides a practical handbook for engineering applications
