the hybrid deliberative layer hdl solves the problem that an intelligent agent faces in dealing with a large amount of information which may or may not be useful in generating a plan to achieve a goal the information that an agent may need is acquired and stored in the dl model thus the hdl is used as the main knowledge base system for the agent in this work a novel approach which amalgamates description logic dl reasoning with hierarchical task network htn planning is introduced an analysis of the performance of the approach has been conducted and the results show that this approach yields significantly smaller planning problem descriptions than those generated by current representations in htn planning
