Systems analysis is the process of studying a procedure or business to identify its goal and purposes and create systems and procedures that will efficiently achieve them another view sees systems analysis as a problem solving technique that breaks a system down into its component pieces and analyses how well those parts work and

1. Systems analysis is a set of approaches for solving complex problems it is of course about systems a system is any set of interacting components such as species in an ecosystem or traders in a market even apparently simple systems with just a few components can do surprising things as feedback loops lead to unpredictable behavior

2. Systems analysis is a methodology that provides a quantitative and systematic assessment of clearly defined issues and alternatives for decision makers from terramechanics and off road vehicle

3. Systems analysis provides a rigorous approach to technical decision making it is used to perform trade off studies and includes modeling and simulation cost analysis technical risks analysis and effectiveness analysis

4. Systems analysis is the first stage in presenting any large task to a computer the other principle stages being design and implementation it is performed by a systems analyst and consists of analyzing the whole task in its setting and deciding how best to arrange it for processing by a computer
