the study of the correlated motion of electrons in solids is of increasing importance in condensed matter physics in the past few years the discovery of high temperature superconductors has stimulated an enormous theoretical effort in this area building on earlier theories of heavy fermion and organic superconductors and magnetic insulators in a separate development the discovery of the fractional quantum hall effect stimulated research into the behavior of the two dimensional electron gas in a strong transverse magnetic field the lectures at this school gave a systematic presentation of the current status of the theory in these areas they covered the fractional quantum hall effect and the many body physics of the hubbard model and its extensions paying particular attention to the properties of doped insulators which are relevant for high temperature superconductivity there were detailed discussions of situations for which controlled calculations may be carried out specifically infinite dimensions one dimension and generalized models in which the fermions have n components and n contents charge fluctuation models of superconductivity p b littlewood investigation of correlated electron systems using the limit of high dimensions d vollhardt the large n expansion in the strong correlation problem g kotliar the semiclassical expansion of the t j model a auerbach the many body problem in one dimension v j emery interacting fermions in one dimension from weak to strong correlation h j schulz the quantum hall effect the article a karlhede et al readership condensed matter theoretical and experimental physicists keywords these articles not only cover a wide range of well established mathematical techniques which are employed in dealing with strongly correlated systems but also consider the physics of some problems of current interest in particular but not exclusively those that are inaugurated by the three successive discoveries in the last decade in order those of the integer and fractional quantum hall effects and that of superconductivity at relatively high temperatures t_c 23k 1980 1982 1986 specific features of materials which upon doping are transformed into high t_c superconductors have given rise to a surge of interest in the quantum anti ferromagnetism and as a consequence models such as the hubbard or the t j model which address this phenomenon form the testing ground for many of the techniques presented in this collection all articles in the present volume are self contained and the authors keep the readers well informed of the connections between their work and those discussed by others in the book each article

begins with a non technical introduction which gives a clear overview of the subject matters dealt within it and ends with some remarks which not only summarize the work but also suggest some future directions of research this along with the clear presentation of the subjects makes this book an ideal source of information for those who wish to enter into the areas of research dealt within this book this collection can also be used as the basis for an advanced course in theoretical physics or as a supplement to an already existing course dealing with the field theoretical methods in condensed matter physics or the theory of critical phenomena and phase transitions students may find it rewarding to organize a series of seminars on the subjects dealt with in the present collection presence of a senior physicist at these seminars will undoubtedly contribute to a deeper understanding of the contents of the book b farid
