at present we may be at the cross roads in the therapeutic approaches we have for the treatment of the 100 or more rheumatic conditions this is because we now recognise that although some advances have been made with the development of a large range of non steroidal and steroidal drugs during the past two decades or so we now recognise that many if not all of these have rather limited effects on many of the disease processes which underlie the manifestations of the various rheumatic states advances in molecular biology in the past 5-10 years have enabled these tools to be applied extensively for developing further our understanding of the rheumatic disease processes in some cases these molecular tools e.g. interferon, interleukin 2, t cell antibodies have been directly employed as therapies themselves while the outcome from trials with such agents in rheumatoid arthritis in particular has not been as would have been hoped these results as with cyclosporin A and low dose methotrexate in the therapy of rheumatoid arthritis have given us important indications for the approach employing what are generally described as immunomodulators to control this disease but this may not be the same type of approach which is desirable for all types of rheumatic conditions indeed even the way which the present range of drugs and other therapies are applied may not be the most effective and safe means of treating different types of arthritic conditions

these two volumes contain the proceedings of a 3 day international meeting held at the university of cambridge and queens college cambridge from 31st july to 2nd august 1985 on the side effects of anti-inflammatory analgesic drugs the first meeting was held in verona italy in 1982 and the organisers felt that with a number of recent developments including the withdrawal of a number of new anti-inflammatory drugs and concern being expressed in the lay and specialist medical press and other media about the safety of these drugs that it was appropriate to have a second such meeting the meeting was attended by some 300 delegates and the discussion focussed most

intently on the recent issues e.g. the value of adverse drug reaction reporting of the non-steroidal anti-inflammatory (NSAID) drugs, certain side effects associated with particular NSAID drugs, the predictive value of animal models etc. Organising a meeting de novo without outside help would not have been possible without the immensely valuable help given enthusiastically by people and financial assistance given most generously by those pharmaceutical companies listed below. These financial contributions were given despite current economic difficulties and moves to restrict the proportion of profits towards educational activities.

## **New Developments in Antirheumatic Therapy**

2012-12-06

This exciting first of its kind title describes the blossoming new science of medicine and management: the concepts, methodologies, techniques and tools that create value for patients, populations, caregivers, staff and healthcare organizations. Developed out of the innovative and powerful Physician Executive MBA program at the Heller School of Social Policy and Management at Brandeis University, *The New Science of Medicine Management* describes what physician leaders need to know and do to fix problems that can erode value in complex healthcare environments in which they practice medicine. The book is motivated by a singular proposition: every physician a leader, every leader a collaborative team player, and a new definition of high-value health care composed of the best 18 of approximately 200 outstanding physician-led business school projects. The book is based on the collective efforts and experiences of 33 authors and coauthors, 28 of whom are physicians and 19 of whom have an MD and an MBA degree. The work is grounded in three important assertions: first, the clinical side of complex professional medical organizations such as hospitals has traditionally been led by highly skilled, highly experienced medical practitioners trained in the underlying biomedical disciplines and applied medical sciences; second, there is research evidence that managers with clinical backgrounds can run better healthcare organizations, and a growing number of physician-led multispecialty groups are outperforming organizations run by lay managers; third, physicians and other caregivers should have some training in the new science of medicine and management. Moreover, and very importantly, the transition from clinician to clinical manager and leader is challenging and requires training in the new science of medicine and management. State of the art, developed by expert physician leaders in the field and replete with a wide range of management insights and lessons, this book asks important questions and offers an exciting and comprehensive resource for all physicians, health administrators and clinicians interested in not only the science of medicine and management and in developing physician-led teams but crucially in ensuring value in healthcare by improving patient outcomes, safety, affordability and employee well-being.
