this book contains a selection of more than 500 mathematical problems and their solutions from the phd qualifying examination papers of more than ten famous american universities the mathematical problems cover six aspects of graduate school mathematics algebra topology differential geometry real analysis complex analysis and partial differential equations while the depth of knowledge involved is not beyond the contents of the textbooks for graduate students discovering the solution of the problems requires a deep understanding of the mathematical principles plus skilled techniques for students this book is a valuable complement to textbooks whereas for lecturers teaching graduate school mathematics it is a helpful reference

a unified account of permutations in modern combinatorics a 2006 choice outstanding academic title the first edition of this bestseller was lauded for its detailed yet engaging treatment of permutations providing more than enough material for a one semester course combinatorics of permutations second edition continues to clearly show the usefulness of this subject for both students and researchers and is recommended for undergraduate libraries by the maa expanded chapters much of the book has been significantly revised and extended this edition includes a new section on alternating permutations and new material on multivariate applications of the exponential formula it also discusses several important results in pattern avoidance as well as the concept of asymptotically normal distributions new chapter an entirely new chapter focuses on three sorting algorithms from molecular biology this emerging area of combinatorics is known for its easily stated and extremely difficult problems which sometimes can be solved using deep techniques from seemingly remote branches of mathematics additional exercises and problems all chapters in the second edition have more exercises and problems exercises are marked according to level of difficulty and many of the problems encompass results from the last eight years

this book is a collection of more than 100 problems selected from the examination questions for a graduate course in theoretical physics every problem is discussed and solved in detail a wide range of subjects is covered from potential scattering to atomic nuclear and high energy physics special emphasis is devoted to relativistic quantum mechanics and its application to elementary processes s matrix theory the role of discrete symmetries the use of feynman diagrams and elementary perturbative quantum field theory the course attaches great importance to recitation sessions where thorough problem solving becomes a true test of mastery of theoretical background the authors are experts in their fields a di giacomo taught theoretical physics for about 20 years g paffuti and p rossi held recitations for several years more recently haris panagopoulos followed suit he assisted the authors in preparing this english version translated from the italian for physicists and especially for graduate and advanced undergraduate students in theoretical physics this book is a positive guide in the intricacies of problem solving a further feature that adds practical value to this book is that most problems correspond to realistic physical processes and their numerical results are compared to experimental values whenever possible request inspection copy

this book provides innovative solutions to fundamental problems in finance such as the valuation of bond and equity the pricing of debt equity and total asset the determination of optimal capital structure etc which are unsolved or poor solved so far the solutions in this book all have the following features based on essential assumptions in line with reality the final solutions are analytical solutions with closed form models the forms and variables of the models are determined by strict and objective logic processes rather than chosen or presumed subjectively such as the new growth model for stock valuation the new capm accounting for total risk rather than only systematic risk the real solution to optimal capital structure based on the trade off between tax shield and bankruptcy cost in addition these basic solutions or models are adjusted easily to various application scenarios

grounded in american pragmatism pragmatist ethics proposes a rethinking of ethics rather than looking to the good a concept for which consensus is difficult to achieve pragmatists instead advocate for tending to the problems of the day james jakób liszka examines how daily practices and institutions are originally conceived and then evolve to solve certain problems and that their failure to do so is the source of most problems liszka argues that the ethical goal therefore is to improve upon these practices and that the sort of practical reasoning that characterizes practices can be enhanced by a more scientific empirical approach but how do we know when changes to practices and institutions are progressive problems will plague the best of communities the better community is the one that succeeds best at solving its problems pragmatist ethics examines various accounts of improvement and progress concluding that the problem solving effectiveness of communities is the key to progressive changes

from problem solving to solution design creating solutions to solve problems can often prove very difficult to accomplish even for seasoned solution designers complex organizational problems have several stakeholders endless variables and a myriad of possible solutions it is hard enough to figure out where to start and even harder to realize what the perfect mutually beneficial solution is with their combined tenure of over fifty years j eduardo campos and erica w campos present their solution designing expertise in from problem solving to solution design so that you can learn from their successes and their failures to craft sustainable solutions for complex problems specifically you will learn how to implement the i d e a s framework that they have been perfecting over the years which includes five critical checkpoints that any solution designer must hit to create solutions that are successfully envisioned negotiated with stakeholders and implemented to last over time identify the essential problem and prioritize your actions to solve it design solution options aligned to your goals engage your stakeholders in the solution and influence the decision making process act on the agreed upon recommendations and execute your governance model sustain the implemented solution by creating a feedback loop treat this book as your field guide it offers clear checkpoints for you to assist your organization in designing effective solutions for complex problems

a bestseller in its french edition this book is original in its construction and its success in the french market demonstrates its appeal it is based on three principles 1 an organization of the chapters by families of algorithms exhaustive search divide and conquer etc on the contrary there is no chapter devoted only to a systematic exposure of say algorithms on strings some of these will be found in different chapters 2 for each family of algorithms an introduction is given to the mathematical principles and the issues of a rigorous design with one or two pedagogical examples 3 for the most part the book details 150 problems spanning seven families of algorithms for each problem a precise and progressive statement is given more importantly a complete solution is detailed with respect to the design principles that have been presented often some classical errors are pointed out roughly speaking two thirds of the book is devoted to the detailed rational construction of the solutions
