MCI and Alzheimer's Dementia 2013 dementia is a state that has implications for several groups there are first those who wish to assess its nature and impact in an objective and scientific fashion using tools of research to uncover dementia s causes effects and parameters the result has been a rapidly expanding literature in diverse disciplines physiology chemistry neurology psychology and sociology among others second there are those professionals and caregivers who work di rectly with patients and other caregivers and who must assess and apply interventions third physicians are involved in diagnosis and treatment so far as possible and are responsible for communicating the ominous meanings of the destructive disease process fourth there are the caregivers who accept accountability for the future of a human who increasingly shows a robbing of the mind in his or her behaviors the needs and stresses of those who care for and about those with progressive dementia are among the most intense imaginable they need support of many kinds frequently without knowing what to ask or of whom to ask it finally there are the patients who increasingly become dependent as their mental competencies decline they need empathic care including answers to questions about cause stabilization or reversal of the de menting process even more they need cure further present and future generations need the assurance of prevention this volume surveys present knowledge about dementia and its consequences

Dementia 1993-03-31 dementia now known as major neurocognitive disorder is not one monolithic disease nor is behavior disturbance driven by one particular neurocognitive dysfunction in fact if we are able to understand it behavior is an excellent form of nonverbal communication there are many different causes of dementia a major challenge with both researching and implementing interventions is viewing dementia and related behaviors as single entities this approach leaves room for critical errors in the treatment of dementia patients beginning with misdiagnosis this book approaches dementia by reviewing cognitive and functional assessments to provide a more accurate diagnosis which then allows physicians to design specific interventions that are tailored to the person and their challenges because person centered care is vital to quality of life and longevity to an aging patient this understanding of individual needs is vital written by experts in the field this book incorporates the latest evidence based behavioral interventions matched to specific deficits behavioral management focuses not on controlling behavior but using it to teach staff and caregivers how to interpret common actions and maximize function for people with major neurocognitive disorders quality of life and individualized care planning will be the theme and the book will provide practical case examples the book begins by introducing dementia and other neurocognitive illnesses contextualizing them both historically and contemporarily next the text focuses on the comprehensive assessment of a person with neurocognitive challenges in order to identify strengths and understand what the person is trying to communicate with their behavior this process allows individualized care planning and behavioral non pharmacologic management to meet the cognitive challenges and maximize individual strengths and thereby improve outcomes making this a cutting edge resource
