a comprehensive introduction to the concepts of joining technologies for hybrid structures this book introduces the concepts of joining technology for polymer metal hybrid structures by addressing current and new joining methods this is achieved by using a balanced approach focusing on the scientific features structural physical chemical and metallurgical polymer science phenomena and engineering properties mechanical performance design applications etc of the currently available and new joining processes it covers such topics as mechanical fastening adhesive bonding advanced joining methods and statistical analysis in joining technology joining of polymer metal hybrid structures principles and applications is structured by joining principles in adhesion based mechanical fastened and direct assembly methods the book discusses such recent technologies as friction riveting friction spot joining and ultrasonic joining this is used for applications where the original base material characteristics must remain unchanged additional sections cover the main principles of statistical analysis in joining technology illustrated with examples from the field of polymer metal joining joining methods discussed include mechanical fastening bolting screwing riveting hinges and fits of polymers and composites adhesive bonding and other advanced joining methods friction staking laser welding induction welding etc provides a combined engineering and scientific approach used to describe principles properties and applications of polymer metal hybrid joints describes the current developments in design of experiments and statistical analysis in joining technology with emphasis on joining of polymer metal hybrid structures covers recent innovations in joining technology of polymer metal hybrid joints including friction riveting friction spot joining friction staking and ultrasonic joining principles illustrated by pictures 3d schemes charts and drawings using examples from the field of polymer metal joining joining of polymer metal hybrid structures principles and applications will appeal to chemical polymer materials metallurgical composites mechanical process product and welding engineers scientists and students technicians and joining process professionals

this book is a research monograph summarizing recent advances related to the molecular structure of water and ice and it is based on the latest spectroscopic data available a special focus is given to radio and microwave frequency regions within the five interconnected chapters the author reviews the electromagnetic waves interaction with water ice and moist substances discussing the microscopic mechanisms behind the dielectric responses well established classic views concerning the structure of water and ice are considered along with new approaches related to atomic and molecular dynamics particular attention is given to nanofluidics atmospheric science and electrochemistry the mathematical apparatus based on diverse approaches employed in condensed matter physics is widely used and allows the reader to quantitatively describe the electrodynamic response of water and ice in both bulk and confined states this book is intended for a wide audience covering physicists electrochemists geophysicists engineers biophysicists and general scientists who work on the electromagnetic radiation interaction with water and moist substances
