neurotoxicology is a broad and burgeoning field of research its growth in recent years can be related in part to increased interest in and concern with the fact that a growing number of anthropogenic agents with neurotoxic potential including pesticides lead mercury and the polytypic byproducts of combustion and industrial production continue to be spewed into and accumulate in the environment in addition there is great interest in natural products including toxins as sources of therapeutic agents indeed it is well known that many natural toxins of broadly differing structure produced or accumulated for predatory or defensive purposes and toxic agents accumulated incidentally by numerous species function to perturb nervous tissue components of some of these toxins have been

shown to be useful therapeutic agents and or research reagents unfortunately the environmental accumulation of some neurotoxic agents of anthropogenic origin especially pesticides and metals has resulted in incidents of human poisoning some of epidemic proportion and high levels of morbidity and mortality furthermore an increasing incidence of neurobehavioral disorders some with baffling symptoms is confronting clinicians it is not clear whether this is merely the result of increased vigilance and or improved diagnostics or a consequence of improved health care in any case the role of exposure to environmental and occupational neurotoxic agents in the etiology of these phenomena as well as neurodegenerative diseases is coming under increasing scrutiny and investigation
