the year 2008 marks the beginning of the baby boomer retirement avalanche just as the different demographics in advanced and most developing countries are becoming more pronounced people are worrying again that developments in global population trends food supply natural resource availability and climate change raise the question as to whether malthus was right after all the age of aging explores a unique phenomenon for mankind and therefore one that takes us into uncharted territory low birth rates and rising life expectancy are leading to rapid aging and a

stagnation or fall in the number of people of working age in western societies japan is in pole position but will be joined soon by other western countries and some emerging markets including china the book examines the economic effects of aging the main proposals for addressing the implications and how aging societies will affect family and social structures and the type of environment in which the baby boomers children will grow up the contrast between the expected old age bulge in western nations and the youth bulge in developing countries has important implications for globalization and for immigration in western countries two topics already characterized by rising discontent or opposition but we have to find ways of making both globalization and immigration work for all for fear that failure may lead us down much darker paths aging also brings new challenges for the world to address in two sensitive areas the politicization of religion and the management of international security governments and global institutions will have to take greater responsibilities to ensure that public policy responses are appropriate and measured the challenges arising within aging societies and the demographic contrasts between western and developing countries make for a fractious world one that is line with the much debated decline of the west the book doesn t flinch from recognizing the ways in which this could become more visible but also asserts that we can address demographic change effectively if governments and strengthened international institutions are permitted a larger role in managing change

and that is one thing we need to relearn that all of life brings its gifts not only the first two or three decades rudolf steiner when are we actually old what happens as we age how will we cope with old age growing old is an art and to grow old in the right way we need spiritual understanding in this enlightening anthology compiled by a director of care homes for the elderly wide ranging cosmological perspectives alternate with detailed observations of the phenomena of ageing rudolf steiner sees ageing within the context of the earthly and spiritual evolution that encompasses all forms of existence the book thus begins with the primary meaning that ageing has in developmental terms and ends with a consideration of the human being as co creator in cosmic processes and with our capacity to become increasingly conscious of the tasks this implies these key texts by rudolf steiner show how spiritual knowledge can broaden the current debate on the study of old age the process of ageing and the particular problems faced by older people concerns about our ageing population can be seen in a broader context that recognizes the fruits of old age the productive relationship between childhood and old age a running theme throughout this

is aging as most people think a fundamental totally unalterable fact of life or is aging actually similar to a universal but potentially highly treatable genetic disease darwin s dilemma a little known quirk of the theory of evolution has for more than 140 years led scientists toward considering aging as inescapable but recent discoveries and new theoretical work indicate that major medical intervention in the aging process may in fact be possible in the relatively near future the author takes us on a fascinating tour of the evolution of aging theories from darwin to the present and includes descriptions of various discoveries and biological oddities that strongly suggest that aging is a treatable condition the most serious obstacle to the development of anti aging medicine may be public opinion a former nasa rocket scientist the author provides an outsider s viewpoint understandable writing and penetrating logical analysis to the often arcane and tradition bound world of aging theory

this book explores positive aging through the lens of precarity aiming to ground positive aging theories in current social contexts in recent years research on aging has been branded by growing disagreements between supporters of the successful aging model and critical gerontologists who highlight the widening inequalities disadvantages and precarity that characterize old age this book comes to fill a gap in knowledge by offering an alternative view on positive aging informed by precarity and its impact on projections concerning aging the first part of the book places aging in broader theoretical and empirical context exploring the complex links between views on aging successful aging theories policy and social reality the second part uses results from a qualitative research conducted in germany to illustrate the dissonance between successful aging ideals and both negative and positive views on aging as well as aging preparation strategies inspired by

precarity findings from this section provide a solid starting point for comparisons with countries that are both similar and different from germany in terms of welfare regimes and aging policies the final part of the book discusses the psychological implications of these findings within and beyond the german case study and outlines potential solutions for practice this book provides health psychologists gerontologists sociologists social workers health professionals as well as students and aging individuals themselves with better understanding of the meaning of aging in precarious times and builds confidence about aging well despite precarity

this second edition of health aspects of aging serves to broaden the perspectives of societal change due to increases in life expectancy as well as the effects of age related changes as they impinge upon the provision of health care for older persons the growing presence of a large number of persons aged 65 and older worldwide has propelled a re evaluation of the nature of life that is protracted to 100 years and beyond the emphasis in this second edition is to replace the prevailing problem approach to aging by a problem solving approach the problem solving approach of this volume has allowed for the incorporation of the concept of new social structures and the development of intervention and prevention strategies along with new technologies such new products and health care measures include those that are deliberately aimed to offset debilities due to normal age changes the onslaught of diseases incongruous environments and altered social states such a multi disciplinary perspective underscores the fact that aging permeates not only biological systems but clinical medicine economics ethics and the very fabric of society the chapters in this volume address these issues from the standpoints of diverse disciplines and professional positions since biological changes are primary issues the aging process is largely described from the perspective of biological changes related to age and to particular dysfunctions the environmental features and the potential introduction of technological interventions are interspersed within chapters as well as finding primary focus in particular chapters the maturity of the technology described in the chapters varies from devices and systems that are nearly ready to be marketed to

concepts and prototypes that are still in the design and developmental stages in the laboratory the relationship between the provision of appropriate health care and the responsible utilization of technologies as described in this volume will serve to enhance the nature of life extension

leben ist die schonste erfindung der natur und der tod ist ihr kunstgriff viel leben zu haben j w v goethe life is the most beautiful invention of nature and death is her device to exhibit most life the eminent british biologist sir vincent b wigglesworth noted in 1939 that insects are an ideal medium in which to study all problems of physiology many fundamental discoveries in biology particularly genetics and development have been made on the basis of studies conducted in insects because of their ex treme adaptability and diversity an appropriate insect model is available for the study of virtually any biological problems the applicability to other groups including mammals of

basic studies conducted on insects has helped in the gradual acceptance of the fundamental unity of biochemical principles as a dogma among biologists as well as among enlightened medical scientists with the recent upsurge of interest in the study of the aging process in insects have been increasingly employed not only for the investigation of basic mechanisms of aging but also to gain insight into the evolution of aging and senescence if only one aging mechanism exists it is foreseeable that some insects especially *Drosophila* will help to unravel its molecular basis because of their diversity existing studies in the gerontology of insects are widely scattered in various specialized journals this wealth of existing information has not as yet been brought together in a synthesized and comprehensive form
